Indications for Mechanical Ventilation. Mechanical ventilation is instituted for a number of reasons . 21 Most commonly, these indications are a combination of a failure to adequately oxygenate, ventilate, or meet the metabolic demands of a physiologically stressed patient. Clinical indicators such as tachycardia, arrhythmias, hypertension, and tachypnea, use of accessory respiratory muscles, diaphoresis, and cyanosis are used to diagnose respiratory distress.

the depth and rate of ventilation with carbon dioxide acting as the primary stimulus for ventilation. Respiration is the exchange of gases between the lungs and pulmonary blood vessels (external respiration) and between the blood and tissues (internal respiration). Oxygen and carbon dioxide move from one area to the other due to pressure gradients.
